In numerical analysis, finite-difference methods (FDM) are a class of numerical techniques for solving differential equations by approximating derivatives with finite differences.Both the spatial domain and time interval (if applicable) are discretized, or broken into a finite number of steps, and the value of the solution at these discrete points is approximated by solving algebraic equations ...

OK, so ultimately, why do we want to use object-oriented programming? So, so far, the examples that we've seen were numerical, right--a coordinate, a fraction. But using object-oriented programming, you can create objects that mimic real life. So if I

wanted to create objects of--an object that defined a cat and an object that defined a rabbit ...
